SKF Sweden AB
von Utfallsgatan 2
415 05 Göteborg

Dear Hiring Manager,

I am a fullstack engineer with 5+ years building cloud applications across React/Angular frontends and Java/C#/Python microservices backends. In the automotive domain, I work handson with Android Auto and invehicle experiences, while partnering across product, platform, and security to deliver compliant, highquality solutions.

My recent work centers on Azure and hybrid/multicloud designs. I build with Azure App Services, Functions, Azure SQL and Azure DevOps, and I bring practical OCI and AWS experience for crosscloud interoperability. I set domain and subdomain policies, introduce CI/CD quality gates (build/test/scan), and collaborate with Cyber Security on identity, secrets, and policyascode so teams can move fast while meeting regulatory needs in multiple markets.

As a bridge between product, platform, and application teams in a multinational environment, I translate business outcomes into roadmaps and engineering constraints into business decisions. This reduces friction, improves alignment, and raises delivery quality. In Android Auto work, I deliver fullstack features with reliable pipelines and testing (unit/integration/e2e) and use performance baselines to maintain a high bar.

I would be excited to bring this mix of fullstack delivery, Azure/OCI pragmatism, and technical leadership to SKF in Gothenburg.

Sincerely,
